Hiring Team

Business / Data Analyst
Fintech Startup (via Qrata)
Bengaluru, India

RE: BUSINESS / DATA ANALYST - APPLICATION

I am applying for the Business / Data Analyst role posted via Qrata. My background in SQL-driven analytics, KPI dashboard ownership, and cross-functional stakeholder reporting maps directly to what the role requires - and I am excited by the opportunity to bring those skills into a fintech product environment.

In my most recent role at Logistics Integrators, I built and owned a **Power BI dashboard tracking 10+ business metrics** across freight ops, sales, and finance. Before that dashboard existed, each team cited different numbers in weekly reviews. After I standardised the metric definitions and delivered a single source of truth, those disputes stopped entirely. I also wrote **SQL queries (CTEs, window functions, aggregations)** to extract and analyse large operational datasets, and ran statistical anomaly detection to flag outliers in shipment delay and cost data - work that maps closely to the kind of transaction-level and product-metric analysis fintech analysts do every day.

I understand I am coming from a logistics operations background rather than financial services. That said, the **analytical challenges are structurally similar**: high-volume data, multi-team stakeholders who need to trust the same numbers, and a constant need to distinguish signal from noise. My dbt Fundamentals certification and hands-on Python (Pandas) data pipeline work signal that I am building toward analytics engineering depth - not just reporting.

I am willing to relocate to Bengaluru and can be available to start with short notice. I would welcome the chance to discuss how my SQL and BI skills can add value to your data and product teams.

Warm regards,

Subham Joshi
