Data Analytics

Coforge

Noida, India

RE: DATA ANALYST - APPLICATION

Your posting names two things most Data Analyst listings leave vague: **complex SQL queries** and **data modeling**. Those happen to be where I have spent the most deliberate effort - most recently in a project where I loaded 805,549 rows of raw e-commerce transaction data into SQLite and wrote 15 advanced queries spanning window functions, CTEs, RFM segmentation, and cohort retention across 5,878 customers in 41 countries. That is the kind of query work I want to be doing daily, not occasionally.

At Logistics Integrators, I have been doing the production version of that work: writing SQL for statistical anomaly detection, owning the **Power BI reporting infrastructure and data models** behind 10+ KPIs, and automating recurring analysis in Python (Pandas, NumPy). I have also completed a dedicated **dbt (data modeling) certification track** and built an end-to-end ELT pipeline from scratch - so "data modeling ability" is not a box I am hoping to grow into; it is something I actively practice and keep building on.

I recognize the experience band you are looking for is slightly above my ~1.5 years - what I would ask you to weigh against that is depth: 9 end-to-end portfolio projects across 1.2M+ real records, working in Agile cycles, and translating technical findings for non-technical stakeholders daily. I am also an **immediate joiner**, based in India and open to working from Noida.

I would welcome the chance to walk through the SQL Retail Analysis project in more detail and discuss how I can contribute from day one.

Warm regards,

Subham Joshi
