RE: RISK DATA ANALYST - APPLICATION

Fraud analytics and risk monitoring are built on a specific kind of detective work: define what normal looks like, set thresholds, watch for deviations, investigate the signals that matter. That is exactly what I have been building - not in fintech, but in logistics operations - and the pattern recognition logic transfers directly.

At Logistics Integrators, I built **SQL-based anomaly detection and threshold-based alerting** on operational datasets. The system surfaced outliers and SLA-impacting signals before they escalated - the same monitoring coverage pattern your fraud ops team needs on earned wage access transactions. When an alert fired, I led the **root-cause investigation**, pulled in 3-5 cross-functional teams to validate the data signal, and tracked the corrective action through to resolution.

I also owned the **data quality and ETL validation** layer: reconciliation, cross-system audits, eliminating discrepancies before they entered downstream reporting. Clean, trustworthy data is the prerequisite for any fraud detection system - I understand that constraint from the inside.

Fraud domain is new to me; the monitoring and investigation workflow is not. I am available to relocate to Bengaluru and happy to set up a 15-minute call to discuss how my operational analytics background maps to your risk data needs.

Warm regards,

Subham Joshi
