Re: Data Analyst (Remote, India)

Dear Peakflo team,

Your JD asks for someone who can detect data quality issues, automate workflows with Python and SQL, and build dashboards that give ops and product a single source of truth. That is what I have been doing for 14 months at Logistics Integrators.

The specifics that map directly: I write SQL with CTEs and window functions to query ops and sales datasets, build and maintain Power BI dashboards tracking 10+ KPIs, and designed threshold-based alerting that catches anomalies and SLA breaches before they escalate. I have also built reconciliation pipelines with ETL audit checkpoints -- the same pattern as your Payment, Billing, and Support ops data. On Python: I use Pandas and NumPy for data manipulation and am actively building automation scripts. Git-based workflow is my daily driver.

On the fintech-specific layer -- fraud monitoring, payment reconciliation, chargeback signal detection -- I have relevant exposure from MBA Ops coursework and have self-studied the operational patterns. The analytical substrate transfers; the fintech domain is what I would build depth in at Peakflo in the first 60 days.

dbt Fundamentals cert (2026), fully remote from Dehradun IST, Americas-shift overlap available.

Best regards,

Subham Joshi
