Re: Data Analyst, Trust & Safety

Dear Resend team,

I am applying for Data Analyst, Trust & Safety. The JD's emphasis on SQL, BI tooling, anomaly detection, and root-cause analysis maps cleanly to what I have built at Logistics Integrators -- and I would bring the "first data analyst on the squad" ownership mindset you have signalled.

For 14 months I have run SQL-based statistical anomaly detection on operational and sales data, designed threshold-based alerting that catches outliers before they hit SLAs, and led root-cause investigations partnering with 3-5 cross-functional teams. Weekly Power BI dashboards as single source of truth. ETL validation and reconciliation as a daily discipline. The Trust & Safety substrate -- pattern detection, signal monitoring, exception triage, queue management -- is what I already do, just on a different substrate.

Tooling: SQL (joins, CTEs, window functions), Python (Pandas, NumPy), dbt (dbt Core, Fundamentals cert earned 2026), Power BI. Looker and Metabase are in my "familiar" tier; the migration to either is small.

On experience: I have 1.5 years vs your 3+ year bar. That is real. What I bring back: deep ownership muscle (Logistics Integrators put me on KPI ownership in month two), MBA Operations 2025 (ICFAI Mumbai), and a willingness to define what a first DA looks like from day one. The dbt cert is proof of self-driven learning on my own clock.

Dehradun, India · IST · Americas-shift overlap OK · fully remote.

Best regards,

Subham Joshi
