ELSA

India

RE: DATA ANALYST - APPLICATION

Most Data Analyst postings list "AI tools" as a nice-to-have. Yours frames curiosity about applying them to analytics work as something you actually want to see - and that is the part of your posting I related to most directly. Outside of my day job, I designed and built **career-ops**, a full job-search automation system, working hands-on with an AI coding agent: a YAML-config-driven OS with hooks, Playwright-based PDF pipelines, and bidirectional database sync that auto-synced 33 application records in a single batch. It is not a claim about AI fluency - it is a shipped artifact of it.

That same instinct - build the system, don't just do the task - is how I have approached my data work. At Logistics Integrators, I **owned metric definitions and data quality for 10+ KPIs**, became the single trusted source of truth that cross-team reporting relied on, and built the SQL-backed Power BI infrastructure behind it. I don't have hands-on Looker experience, but Looker's SQL-first, model-driven philosophy is exactly how I already think about BI - the tool changes, the underlying discipline of designing for self-serve doesn't.

I recognize EdTech is a new domain for me, and a logistics background isn't the most obvious lead-in to it. What transfers directly is the muscle your posting actually weights most: translating ambiguous questions into clear analyses, owning the definitions behind a metric, and using AI tools to spend less time on routine pulls and more on judgment. I'd welcome the chance to walk through how I built career-ops and how that same approach would apply to ELSA's data.

Warm regards,

Subham Joshi
