RE: OPERATIONS MANAGER (FINCRIME) - APPLICATION

Building FinCrime systems from zero to one means designing the logic that decides what counts as "suspicious" before any process exists to catch it. That is precisely the problem I solved when I built a fraud-detection engine on 283,726 real credit-card transactions - combining Z-score, IQR, and rule-based risk scoring (0-100) to flag 2,838 records at a 0.17% rate, matching the dataset's known fraud prevalence with no labeled ground truth to start from.

That same pattern - **spotting the signal, building the threshold logic, and automating the response** - is how I have operated at Logistics Integrators. I built SQL-based statistical anomaly detection and threshold alerting that surfaced operational outliers before they became SLA breaches, then owned the root-cause investigations end-to-end: validating data with 3-5 cross-functional teams and shipping corrective actions through to resolution. Where manual workflows created friction, I replaced them - automating recurring reporting in Python (Pandas, NumPy) and driving the data-integrity work that made our numbers trustworthy enough to act on.

I recognize FinCrime is a new domain for me, and I am not going to pretend otherwise. What I bring instead is a proven ability to **build the detection-and-response loop from scratch** - proof points include not just the fraud-detection project but a full personal automation system (career-ops) I designed and built end to end, currently running a 33-record batch sync and managing 15 certifications under one source of truth. My MBA in Operations Management adds the structured thinking to scale that work across teams, not just build it for myself.

I am based in Dehradun and set up to work remotely across India. I would welcome a 15-minute call to discuss how this background fits the scope of the role.

Warm regards,

Subham Joshi
